Answer :

Explanation:
See explanation below.
Explanation

1. Open the Admin Center and go to Users > Active Users
2. Open Multi-factor authentication

Don't select any user yet, just open the Multi-factor authentication screen. You will find the button in the toolbar.

3. Open the Service settings

Before we start enabling MFA for the users, we first go through the service settings. The button to the settings screen doesn't stand out, but it's just below the title

4. Setup MFA Office 365

A few settings are important here:

- * Make sure you check the App password. Otherwise, users can't authenticate in some applications (like the default mail app in Android).

- * Also, take a look at the remember function. By default, it is set to 14 days.

5. Enable MFA for Office 365 users

After you have set the settings to your liking click on save and then on users (just below the title Multi-factor authentication).

You see the list of your users again. Here you can select single or multiple users to enable MFA.

At the moment you enable Office 365 MFA for a user it can get the setup screen as soon as the users browse to one of the Office 365 products.

NEW QUESTION: 2

A private school wants to use Salesforce to manage students, their parents, staff operations, and fundraising.

The school wants to use the Education Data Architecture (EDA) and to create Giving Pages.

What is a compatibility consideration the consultant should discuss with the school?

- A. Accounting Subledger is installed.
- B. Elevate is incompatible with Advisor Link.
- C. Person Accounts must be enabled.
- D. Gift Entry Manager is required.

Answer: A

NEW QUESTION: 3

Which option requires the fewest components to implement a fault-tolerant, load-balanced solution for end-user access at each datacenter?

- A. Three NetScalers in a cluster, with load balancing pointing

to two StoreFront servers belonging to the same StoreFront server group.

B. Two NetScalers in a high availability pair, with load balancing pointing to two StoreFront servers belonging to the same StoreFront server group.

C. Two StoreFront servers in a single StoreFront server group.

D. Two NetScalers in a high availability pair, with load balancing pointing to a single StoreFront server.

Answer: D

NEW QUESTION: 4

A common way to create fault tolerance with leased lines is to group several Tls together with an inverse multiplexer placed:

A. in the middle of the connection.

B. somewhere between both end points.

C. at both ends of the connection.

D. at one end of the connection.

Answer: C

Explanation:

Explanation/Reference:

A common way to create fault tolerance with leased lines is to group several Tls together with an inverse multiplexer placed at both ends of the connection.

In fact it would be a Multiplexer at one end and DeMultiplexer at other end or vice versa. Inverse Multiplexer at both end.

In electronics, a multiplexer (or mux) is a device that selects one of several analog or digital input signals and forwards the selected input into a single line. A multiplexer of $2n$ inputs has n select lines, which are used to select which input line to send to the output. Multiplexers are mainly used to increase the amount of data that can be sent over the network within a certain amount of time and bandwidth. A multiplexer is also called a data selector.

An electronic multiplexer makes it possible for several signals to share one device or resource, for example one A/D converter or one communication line, instead of having one device per input signal.

On the other hand, a demultiplexer (or demux) is a device taking a single input signal and selecting one of many data-output-lines, which is connected to the single input. A multiplexer is often used with a complementary demultiplexer on the receiving end.

An electronic multiplexer can be considered as a multiple-input, single-output switch, and a demultiplexer as a single-input, multiple-output switch
