BGP is a routing protocol that uses the TCP protocol to establish connections between routers. The BGP state machine has several states, including Established, Idle, and Connect. The state of a BGP session is determined by the state of the TCP connection and the state of the BGP session.

- A.** Established
- B.** Idle
- C.** Connect
- D.** BGP ID
- E.** IP address, local AS, remote AS, internal link

Answer: B, E

Explanation:

Use the show ip bgp neighbors (registered customers only) command to display information about the TCP and Border Gateway Protocol (BGP) connections and verify if the BGP peer is established. The output of the show ip bgp neighbors command below shows the BGP state as

'Established', which indicates that the BGP peer relationship has been established successfully.

R1-AGS# show ip bgp neighbors | include BGP

BGP neighbor is 10.10.10.2, remote AS 400, internal link BGP

version 4, remote router ID 2.2.2.2 BGP state = Established, up for 00:04:20 BGP table version 1, neighbor version 1 R1-AGS#
The show ip bgp neighbors command has been used above with the modifier | include BGP. This makes the output more readable by filtering the the command output and displaying the relevant parts only.

In addition, the show ip bgp summary (registered customers only) command can also be used to display the status of all BGP connections, as shown below.

```
R1-AGS(9)# show ip bgp summary
BGP router identifier 10.1.1.2, local AS number 400 BGP table
version is 1, main routing table version 1 Neighbor V AS
