NEW QUESTION: 2

Your network contains an Active Directory domain named contoso.com. The domain contains a member server named Server1. Server1 runs Windows Server 2012 and has the Hyper-V server role installed.

Server1 hosts 10 virtual machines. A virtual machine named VM1 runs Windows Server 2012 and hosts a processor-intensive Application named App1.

Users report that App1 responds more slowly than expected. You need to monitor the processor usage on VM1 to identify whether changes must be made to the hardware settings of VM1. Which performance object should you monitor on Server1?

- A. Processor
- B. Hyper-V Hypervisor Virtual Processor
- C. Process
- D. Hyper-V Hypervisor Root Virtual Processor
- E. Hyper-V Hypervisor Logical Processor

Answer: B

The "Hyper-V Hypervisor Root Virtual Processor" and "Hyper-V Hypervisor Virtual Processor" are just slices of the LP counter and can help you understand how much total CPU the root and guests are using on the system.

The goal here is to monitor VM1 through Server1. Hyper-V Hypervisor Virtual Processor will do that.

Explanation:

- A. Traditionally, processor performance can be measured using the "\Processor(*)\% Processor Time" performance monitor counter. This is not an accurate counter for evaluating processor utilization of a guest operating system though because Hyper-V
- B. Shows the percentage of time used by the virtual processor in guest code. This is used to determine the processor utilization of the virtualization stack on the host server.
- C. Identifies how much of the physical processor is being used to run the virtual machines. This counter does not identify the individual virtual machines or the amount consumed by each virtual machine.
- D. This counter is a natural choice that will give use the amount of time that this particular process spends using the processor resource.
- E. Identifies how much of the virtual processor is being consumed by a virtual machine.

NEW QUESTION: 3

Redshift leader nodes are charged as EC2 instances.

Choose the correct answer:

- A.** True
- B.** False

Answer: B

Explanation:

Compute node hours are the total number of hours you run across all your compute nodes for the billing period. You are billed for 1 unit per node per hour, so a 3-node data warehouse cluster running persistently for an entire month would incur 2,160 instance hours. You will not be charged for leader node hours; only compute nodes will incur charges.
