NEW QUESTION: 1

A post-breach forensic investigation revealed that a known vulnerability in Apache Struts was to blame for the Equifax data breach that affected 143 million customers. A fix was available from the software vendor for several months prior to the intrusion. This is likely a failure in which of the following security processes?

- A. Patch management
- B. Secure deployment lifecycle
- C. Security awareness training
- D. vendor risk management

Answer: A

Explanation:

Patch management is that the method that helps acquire, test and install multiple patches (code changes) on existing applications and software tools on a pc, enabling systems to remain updated on existing patches and determining that patches are the suitable ones. Managing patches so becomes simple and simple.

Patch Management is usually done by software system firms as a part of their internal efforts to mend problems with the various versions of software system programs and also to assist analyze existing software system programs and discover any potential lack of security features or different upgrades. Software patches help fix those problems that exist and are detected solely once the software's initial unharness. Patches mostly concern security while there are some patches that concern the particular practicality of programs as well.

NEW QUESTION: 2

Refer to the exhibit. A network technician has added host A to the network. Host A cannot communicate on the network. A ping that is issued on the host to address 127.0.0.1 fails. What is the problem?

- A. The TCP/IP protocols are not loaded.
- B. The router is not forwarding the ping packets to network 127.0.0.0.
- C. The default gateway is incorrect.
- D. The remote host at 127.0.0.1 is unreachable.
- E. The IP address of host A is incorrect.

Answer: A
